DaySight MCP for Workday

Your Workday security, unchanged.

Ask about your Workday data in plain English.

Executive security summary · 8 slides

THE SHORT VERSION

Three things to know

1

Runs on your own PC

No DaySight server, no cloud service, no system in between.

2

Workday stays in charge

Every request runs as the signed-in person. Workday decides what comes back.

3

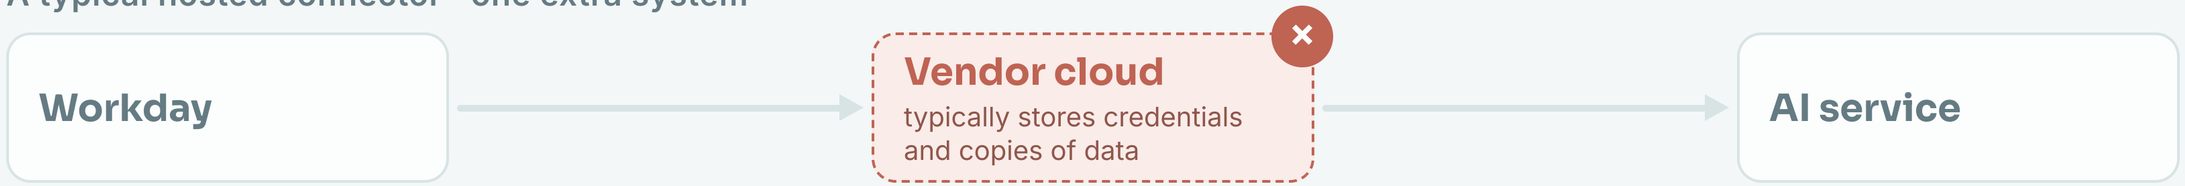

Read-only

It can look. It cannot create, change or delete anything in Workday.

NO SYSTEM IN BETWEEN

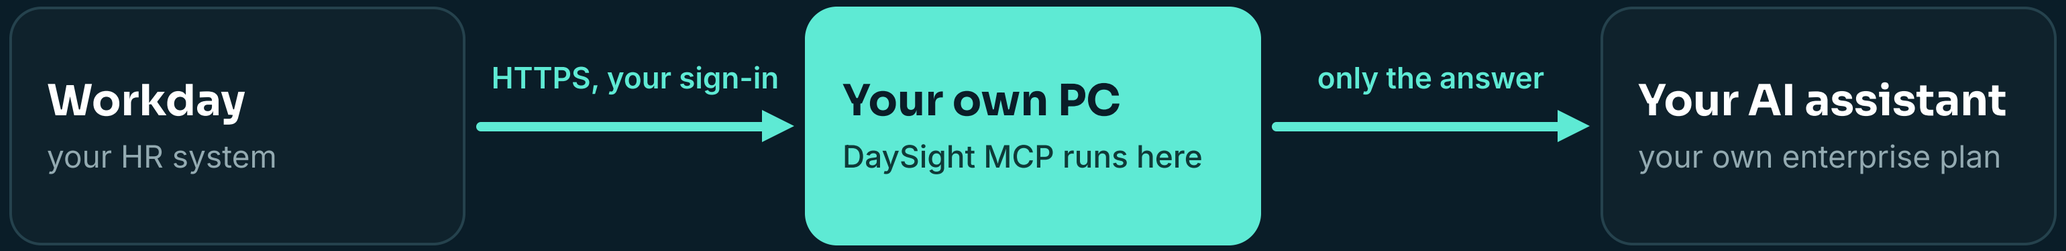

Your data takes the short path

A typical hosted connector · one extra system

DaySight MCP · the safer path

0 systems in between

No intermediary between you and your data

USER SECURITY STAYS IN WORKDAY

Two layers, both controlled by you

1

The API Client sets the outer limit

Your Workday administrator chooses its scopes. Nobody can reach beyond them.

2

The user's own permissions decide the rest

People sign in with their own Workday account. Workday applies their security groups to every call.

What you keep

- Your existing Workday permissions
- No new passwords or user directory
- API activity visible in Workday
- Switch access off in Workday at any time

PROTECTED BY DESIGN

Read-only, with sensitive data held back

READ-ONLY

No write tools

Anything that is not a read request is refused.

ALWAYS REMOVED

Personal details

Home and personal contact details, national IDs and bank details.

NEVER RETURNED

Most sensitive

Religion, sexual orientation, and candidate names and contacts.

SMALL GROUPS

Hidden under 3

Group results under a minimum size are suppressed. The size is adjustable.

Worker names, work email and work phone are returned when asked for, if the user's Workday permissions allow it.

STAYS ON THE COMPUTER

Secrets never reach the AI

- **No client secret needed** with PKCE. If you use one, it stays on your PC
- **Sign-in token** stored encrypted in the user's Windows profile
- **Never in answers or logs**, so the AI model never sees a secret
- **No "call any URL" tool**: only the Workday operations the server lists
- **Audit logs** record tool, status and duration, never values
- **Every release** ships with a SHA-256 checksum to verify the download

THE ONE DECISION FOR LEADERSHIP

Choose your AI provider with care

Whatever the assistant retrieves is sent to the AI provider as part of the conversation. For HR data, use **Claude Enterprise or ChatGPT Enterprise** with data sharing and model training turned off.

BEFORE YOU ROLL OUT

- Your HRIS administrator registers the API Client
- Start on a sandbox or implementation tenant
- Give it the smallest set of scopes that covers the questions
- Check your policy on sending HR data to AI

NEXT STEP

Start small, check, then decide

01

Try it on a sandbox

Each Workday tenant gets a free 30-day trial.

02

Pilot a small group

Smallest scopes, a few named users.

03

Review in Workday

Check the API activity for the client.

04

Decide

Widen the scopes, or switch it off in Workday.
